

Streamlit is an open-source Python framework that allows developers and data scientists to build interactive, shareable web applications in minutes. It eliminates the need for frontend web development (like HTML, CSS, or JavaScript), enabling you to build beautiful UIs using pure Python. [1, 2]

Key Features

- **Pure Python:** You only need to write Python code to design forms, buttons, sliders, and charts.
- **Instant Deployment:** Applications can be hosted for free directly from GitHub using the [Streamlit Community Cloud](#).
- **Live Reloading:** As you edit and save your Python script, your web application updates in real-time. [1, 2, 3, 4, 5]

Why It Is Used

It is highly popular for proof-of-concept projects, machine learning dashboards, and generative AI tools. Instead of struggling with complex backend frameworks, users can deploy a sleek, interactive frontend interface directly on top of data science libraries like Pandas, NumPy, or Matplotlib.
